USE
KRYSTEXXA is a prescription medicine used in adults to help reduce the signs and symptoms of gout that are not controlled by other treatments.

SELECT IMPORTANT SAFETY INFORMATION
What is the most important information I should know about KRYSTEXXA (pegloticase)?

Serious allergic reactions may happen in some patients who receive KRYSTEXXA. These allergic reactions can be life threatening and usually happen within 2 hours of the infusion.

Please see additional Important Safety Information on pages 14-15 and Medication Guide at KRYSTEXXA.com.
Gout is not only painful, but finding a medicine that works for you can be challenging. Even if you don’t have flares, you can have uric acid crystal buildup in your body. This buildup can form lumps of uric acid crystals that can be visible or nonvisible, depending on where your buildup is in your body. Visible lumps are called tophi (TOE-фи-EYE).

Both visible and nonvisible buildup can cause permanent joint damage and put you at risk of having flares.

It’s natural to feel discouraged when your gout medicine isn’t getting the job done. For people whose current gout medicine isn’t working well enough, KRYSTEXXA can help you regain control.

Uric Acid Crystals Can Take Years to Build Up

With KRYSTEXXA, Crystal Buildup Can Dissolve in Just Months

SELECT IMPORTANT SAFETY INFORMATION

Who should not receive KRYSTEXXA?

Do not receive KRYSTEXXA if you have a rare blood problem called glucose 6-phosphate dehydrogenase (G6PD) deficiency or favism. Your doctor should test you for G6PD before you start KRYSTEXXA.

Please see additional Important Safety Information on pages 14-15 and Medication Guide at KRYSTEXXA.com.
To Get Rid of Uric Acid Crystal Buildup, Get Into the Dissolve Zone

The “dissolve zone” is the level where uric acid crystals can begin to dissolve. The goal of your gout treatment is to get your uric acid level into this zone.

Getting into the dissolve zone allows your crystal buildup to start dissolving. When you are in this zone, the lower you get your uric acid level, the faster your crystal buildup will dissolve.

Get Into and Stay in the Dissolve Zone With KRYSTEXXA

• Studies with KRYSTEXXA showed that 42% of people for whom other treatments did not work got their uric acid levels into the dissolve zone
• People got into the dissolve zone within 24 hours after their first treatment
• Even though they got into the dissolve zone right away, taking KRYSTEXXA for 6 months kept them in the dissolve zone. This allowed years of uric acid crystal buildup to dissolve

SELECT IMPORTANT SAFETY INFORMATION

What are the possible side effects of KRYSTEXXA?

The most common side effects in patients taking KRYSTEXXA were gout flare-ups or attacks, allergic reactions, nausea, bruising, sore throat, constipation, chest pain, and vomiting.

This is not a complete list of all possible side effects. Tell your doctor or treatment team if you have any side effect that bothers you or that does not go away.

Please see additional Important Safety Information on pages 14-15 and Medication Guide at KRYSTEXXA.com.
KRYSTEXXA Can Rid of Years of Crystal Buildup in Just Months

Nearly half of the people treated saw complete elimination of at least 1 tophus after 6 months of treatment with KRYSTEXXA. No new tophi formed during treatment.

KRYSTEXXA Can Dissolve Both Visible and Nonvisible Buildup

Imagine a snowy day...

Uric acid crystals build up over time in your body, similar to how snow collects on the sidewalk.

KRYSTEXXA is an enzyme that helps uric acid crystals dissolve, similar to how salt melts snow.

Dissolved uric acid crystals leave your body through the urine, similar to how melted snow flows down a drain.

SELECT IMPORTANT SAFETY INFORMATION

What is the most important information I should know about KRYSTEXXA (pegloticase)?

Serious allergic reactions may happen in some patients who receive KRYSTEXXA. These allergic reactions can be life threatening and usually happen within 2 hours of the infusion.

Please see additional Important Safety Information on pages 14-15 and Medication Guide at KRYSTEXXA.com.
KRYSTEXXA is Given Differently and Starts Working Immediately

KRYSTEXXA is a short-term medicine given every 2 weeks¹
- As you go through treatment, you and your doctor will decide how long you should take KRYSTEXXA. In clinical studies, KRYSTEXXA was given every 2 weeks for 6 months
- KRYSTEXXA is given directly into the bloodstream and starts working right away to get you into the dissolve zone. This process is known as an intravenous (IV) infusion

Should I Take My Daily Gout Medicine While on KRYSTEXXA?

While on KRYSTEXXA:
Your doctor may have you stop taking some of the oral medicines you take regularly for gout. Once you dissolve your crystal buildup, it can be easier to stay in the dissolve zone even after you stop taking KRYSTEXXA.

After Taking KRYSTEXXA:
You may or may not return to a daily gout medicine to:
- Help you stay in the dissolve zone
- Prevent uric acid crystals from building up again

SELECT IMPORTANT SAFETY INFORMATION
Tell your doctor or nurse right away if you have any of these symptoms during or after your treatment with KRYSTEXXA:
- Wheezing, shortness of breath, cough, chest tightness, chest pain, or trouble breathing
- Dizziness, fainting, fast or weak heartbeat or feeling nervous
- Reddening of the face, itching, hives, rash, or feeling warm
- Swelling of the throat or tongue, throat tightness, hoarse voice or trouble swallowing

Please see additional Important Safety Information on pages 14-15 and Medication Guide at KRYSTEXXA.com.
Before Your 1st Infusion:

Your doctor will order a blood test to check:

- Your current uric acid level
- Your G6PD enzyme activity (to see if you have a rare blood marker that would prevent you from receiving KRYSTEXXA)

On Infusion Day (Every 2 Weeks):

- A small needle is inserted into your arm to start the infusion
- The infusion itself only takes 2 hours, but you should plan additional time for pre-infusion prep and a short observation post-infusion, depending on your infusion center
- During your infusion, you are free to do as you please (read, use your smart device, etc)

1-2 Days Before Your Next Infusion:

Your doctor will order a blood test to check:

- Your uric acid level to see how KRYSTEXXA is working. This blood test can also help your doctor know if you’re at risk of an allergic reaction.

Remember, KRYSTEXXA is a short-term, not a lifelong, treatment.

What to Expect: From Your First to Your Final KRYSTEXXA Infusion

Prior to your treatment with KRYSTEXXA, your doctor may give you medicine to help reduce your chance of getting a reaction. Take these medicines as directed by your doctor or nurse. Your doctor will also test your uric acid levels prior to each treatment to monitor your response to KRYSTEXXA.
Frequently Asked Questions About KRYSTEXXA

KRYSTEXXA starts working within 24 hours. People in the clinical studies were given KRYSTEXXA for 6 months in order to stay in the dissolve zone to get rid of years of uric acid crystal buildup.

Why can't I take KRYSTEXXA as a pill?

KRYSTEXXA is a delicate enzyme that would be destroyed in your stomach if taken as a pill.

Do I have to get KRYSTEXXA infused every 2 weeks?

Yes. People in the clinical studies had the best results when they were given KRYSTEXXA every 2 weeks.

Do I still take my other gout medicine(s) with KRYSTEXXA?

While taking KRYSTEXXA, do not take any other uric acid-lowering drugs, such as allopurinol or febuxostat (Uloric®). Your doctor may give you medicine (colchicine and/or NSAIDs) to help with any gout flares you may have while on KRYSTEXXA. In preparation for your KRYSTEXXA infusion, your doctor may also give you antihistamines and corticosteroids.

Will I have gout flares while taking KRYSTEXXA?

With KRYSTEXXA, gout flares are a common side effect, but many people in the clinical studies said they were having fewer flares by the end of treatment. Your doctor may give you medicine (colchicine and/or NSAIDs) to help with any gout flares you may have while on KRYSTEXXA.

What happens if I have an allergic reaction?

A nurse or assistant will be with you to ensure any allergic reactions are treated. In the clinical studies, all allergic reactions, including serious allergic reactions, were treated at the infusion center with medicines or by stopping the infusion. Most were resolved using common medications such as Benadryl®.

What happens if I miss an infusion?

Making time for your infusions can be challenging, but in order to see the best results with KRYSTEXXA, it’s important to receive your infusion every 2 weeks. If you are going to miss an appointment, contact your doctor as soon as possible to reschedule.

What happens after I finish taking KRYSTEXXA?

You and your doctor will decide on a plan to keep uric acid crystals from building up again.

Please see additional Important Safety Information on pages 14-15 and Medication Guide at KRYSTEXXA.com.
Important Safety Information

USE
KRYSTEXXA is a prescription medicine used in adults to help reduce the signs and symptoms of gout that are not controlled by other treatments.

IMPORTANT SAFETY INFORMATION

What is the most important information I should know about KRYSTEXXA (pegloticase)?

Serious allergic reactions may happen in some patients who receive KRYSTEXXA. These allergic reactions can be life threatening and usually happen within 2 hours of the infusion.

KRYSTEXXA should be given to you by a doctor or nurse in a healthcare setting where serious allergic reactions can be treated. Your doctor or nurse should watch you for any signs of a serious allergic reaction during and after your treatment with KRYSTEXXA.

Tell your doctor or nurse right away if you have any of these symptoms during or after your treatment with KRYSTEXXA:

- Wheezing, shortness of breath, cough, chest tightness, chest pain, or trouble breathing
- Dizziness, fainting, fast or weak heartbeat or feeling nervous
- Reddening of the face, itching, hives, rash, or feeling warm
- Swelling of the throat or tongue, throat tightness, hoarse voice or trouble swallowing

Who should not receive KRYSTEXXA?

Do not receive KRYSTEXXA if you have a rare blood problem called glucose 6-phosphate dehydrogenase (G6PD) deficiency or favism.

Your doctor should test you for G6PD before you start KRYSTEXXA.

KRYSTEXXA is not recommended if you have high levels of uric acid without a history of gout.

Before you receive KRYSTEXXA, tell your doctor if you:

- Know you have G6PD deficiency
-Ever had any heart problems or high blood pressure
- Are pregnant or planning to become pregnant. It is not known if KRYSTEXXA will harm your unborn baby
- Are breastfeeding or plan to breastfeed. It is not known if KRYSTEXXA passes into your breast milk

Tell your doctor about all the medicines you take. Do not take any other uric acid lowering drug, such as allopurinol or febuxostat (Uloric®), while taking KRYSTEXXA.

Prior to your treatment with KRYSTEXXA, your doctor may give you medicine to help reduce your chance of getting a reaction. Take these medicines as directed by your doctor or nurse. Your doctor will also test your uric acid levels prior to each treatment to monitor your response to KRYSTEXXA.

What are the possible side effects of KRYSTEXXA?

Please review important information section above. The most common side effects in patients taking KRYSTEXXA were gout flare-ups or attacks, allergic reactions, nausea, bruising, sore throat, constipation, chest pain, and vomiting.

This is not a complete list of all possible side effects. Tell your doctor or treatment team if you have any side effect that bothers you or that does not go away.

Please see the Medication Guide at KRYSTEXXA.com.

You are encouraged to report negative side effects of prescription drugs to the FDA. Visit www.fda.gov/safety/medwatch, or call the FDA at 1-800-FDA-1088.
Regaining Control of Gout Is Possible. Are You Ready?

Talk to your doctor or nurse about getting started on KRYSTEXXA and visit KRYSTEXXA.com for more information.

Services and savings are available to help you during treatment! See the next brochure in this kit to learn more.
